

Blue Jay

A gentle cold blue LED with laser light therapy infused with Scalar waves, works through the toenail with blue light and scalar waves for rejuvenation of the cells. The device helps with destroying the pathogens that cause toenail fungus (Onychomycosis) The device is a technological breakthrough in the treatment of nail fungus, since it actually provides treatment with the most impressive results for those suffering from nail fungus 4 week treatment.

How the device compares to the oral medication Lamisil?

The laser has a higher cure rate than Lamisil based on studies. Unlike the oral medication, the laser does not require blood testing, has no interactions with any medications, and has no risk of liver toxicity or allergic reactions. People who are suffering and seek treatment for nail fungus can now effectively treat the nail fungal infections without spending large sums of money, save on time to get laser treatment at laser centers.

Of course, lasers are a very sexy, modern, technologically advanced approach to the treatment of a variety of human diseases. Lasers produce coherent light energy of a sufficient strength and of a specific wavelength which when projected into tissue is differentially absorbed by the target material, Infused Scalar waves into the device help with the process.

How does the device work:

Blue Jay destroys the fungus that lives in and under the toenail. The laser light passes through the toenail without causing damage to the nail or the surrounding skin. At the time of the procedure, the toenail will not become instantly clear, it takes time to grow out. Just like the oral antifungal medications, response is measured in weeks as the nail grows out clear.

- **Safe.**
- **Does not harm the nail or skin.**
- **Noninvasive, painless, no side effect, easy to use, miniature size for portable use anytime anywhere.**
